satelettronica

Technical information should always be available to the foremen and mechanics, because their careful and constant adherence to the instructions is essential to ensure vehicle road-worthiness and safety. In addition, the normal basic safety precautions for working on motor vehicles must, as a matter of course, be observed.

01 - Self-diagnosis, Electrical check

1 - Self-diagnosis function

1.1 - Self-diagnosis function

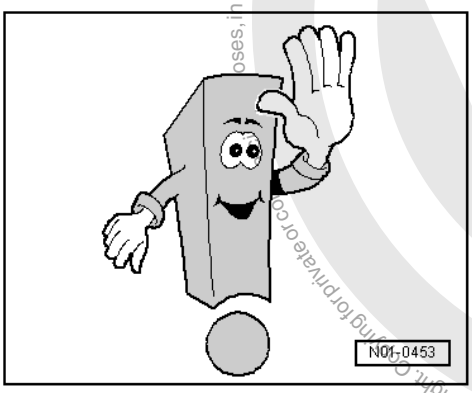
The automatic gearbox is controlled electro-hydraulically.

The term "self-diagnosis" is specifically for the electronic/electric control.

Always perform a self-diagnosis before the fault search.

Additional information

- Workshop Manual Caddy 1996 ▸, Polo Classic 1996▸, Polo Estate 1998 ▸, Automatic gearbox 01M
- Current flow diagrams, Electrical fault finding and Fitting locationsbinder
- Self-study programme No.172.



Data bus

Vehicles with data bus (from 10.99 ▸)

Comprehensive information on the "data bus" is given in self study programme No. 186.

Advantages:

- Rapid data transfer between the control units
- Less wiring in vehicle

The automatic gearbox control unit sends signals into the data bus and uses signals from it. It exchanges signals (information) with other control units.

Examples of signals from data bus (sent by engine control unit)

- Accelerator pedal position (throttle valve position)
- Kickdown
- Engine speed
- Engine torque

Examples of signals into data bus (used by engine control unit)

- Cruise control system

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

- Ignition timing influences

Not only do the engine control units but also other control units exchange data with each other via the data bus, as in this example.

For example, the dash panel insert with diagnostic interface for data bus -J533- (or -J285-) receives the speed signal via the data bus from the automatic gearbox control unit.

It is often the case that other systems can be coded. If they are incorrectly coded, then the automatic gearbox control unit identifies signals from them as incorrect. In this way, faults will be detected which do not have their origin in the automatic gearbox although the faults are stored in its fault memory.

If the automatic gearbox control unit detects that signals are missing or faulty, the data bus itself, another diagnostic system or a component of that system may be defective.

Therefore, always perform self-diagnosis of affected control units.

The vehicle system test in the operating mode, "guided fault finding" is especially appropriate for this.

=> Operating instructions for Vehicle Diagnosis, Testing and Information System VAS 5051.

But it is also possible in the operating mode "self-diagnosis".

When using the current flow diagram to check the routing of wiring, please ensure that the data bus wiring is okay.

Functions of gearbox control unit

The automatic gearbox control unit -J217- receives information from components that effect selection of gears and passes the information on to the valve body solenoid valves which via hydraulic switching control the switch elements.

The control unit is equipped with a fault memory so that in the event of an electronic/electrical component failure or an open circuit the fault can be determined quickly. Fault are recognized by electrical signals and stored in the fault memory.

Control unit -J217- with driving situation gear changes (fuzzy logic)

Determining the driving situation and driving resistance dependent gear change point happens automatically.

Advantages:

- Gear changes will be consumption orientated
- Maximum engine output is always available
- Individual adaption of gear change points in all driving situations

Gearbox control unit fault recognition

The control unit recognizes faults during vehicle operation and stores them in a fault memory => Fault tables, from page 7

After analysing the information the control unit distinguishes between sporadic faults and faults present at this moment (static) and stores these.

If the fault is not present for a predetermined time or when driving over a longer distance, it is no longer recognized and becomes a sporadic fault.

A fault is also changed to a sporadic fault when the fault memory is not erased after repairs.

Sporadic faults will be displayed as "sporadically occurring faults" when the fault memory is interrogated.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelitronica

If the sporadic fault is not present for a predetermined time or when driving over a longer distance, the fault is erased in the fault memory.

Safety functions of gearbox control unit

If faults occur whilst driving, the control unit can activate supplementary functions or an emergency running programme. They can affect the quality and function of the gear changes.

If critical faults occur when driving, the gearbox will continue to operate in an emergency running mode. If the fault occurs in "D", "3" or "2", then 3rd gear emergency mode is activated.

If the fault occurs in "1","P", "N" or "R" then the emergency running mode for that stage is activated.

If the engine is started again in the emergency running mode and the fault occurs when selector lever is in position "D", "3" or "2" then 3rd gear is activated hydraulically, until the fault is rectified.

The gearbox will remain in emergency running mode; until the fault is no longer recognized by the control unit over a predetermined period.

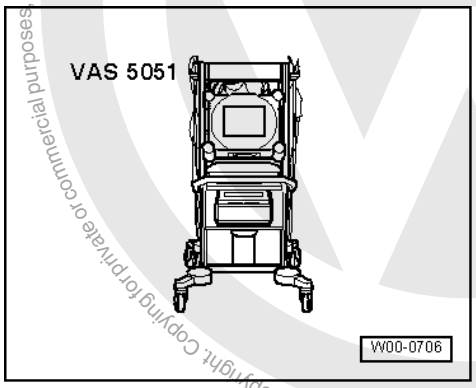
Faults which may lead to emergency running:

Open circuit in wiring, short-circuit, electrical or hydraulic components defective.

Renewing control units

If control units are renewed, the system must be put into the basic setting => Page 15 , Initiating basic setting.

Vehicle diagnosis, testing and information system VAS 5051



Electrical faults that affect vehicle performance can be determined with these devices.

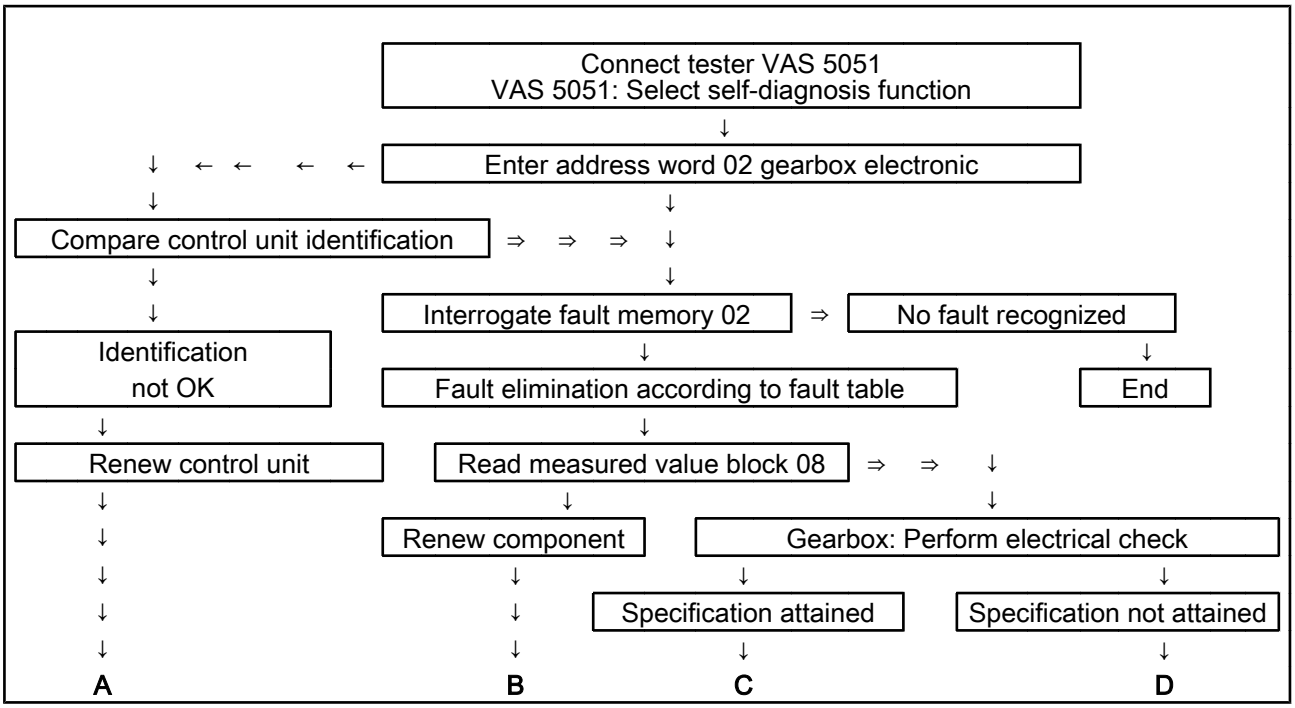
The VAS 5051 offers beside self-diagnosis the "Guided fault finding" and "Measuring technology". Both are excellent for locating faults in the gearbox.

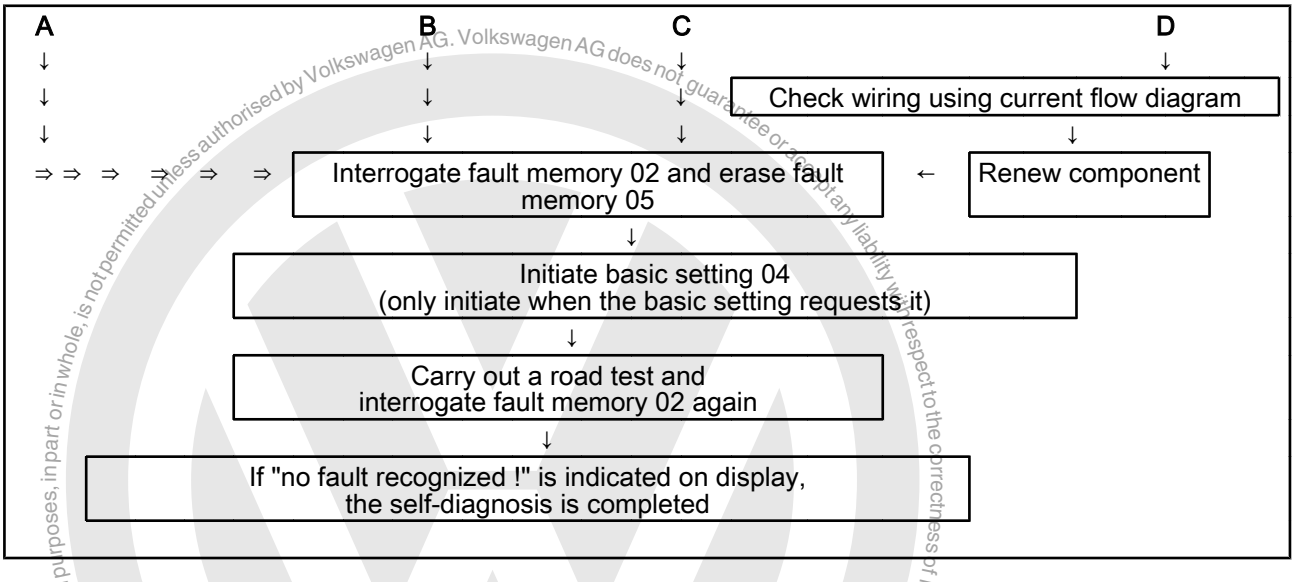
Self-diagnosis technical data

Memory	
-Permanent memory - Volatile memory	yes no
Data transfer between control units via: - single wires	up to 09.99
- Data bus	from 10.99
Final control diagnosis	no
Basic setting	yes
Coding control unit	no

satelettronica

1.2 - Self-diagnosis - Guide for automatic gearbox





If after the self-diagnosis is completed, the automatic gearbox continues to operate with faults, then the cause can be.

found in the operating mode "guided fault finding".

You should also refer to the

=> "Fault finding" binder. Power transmission; No. 14

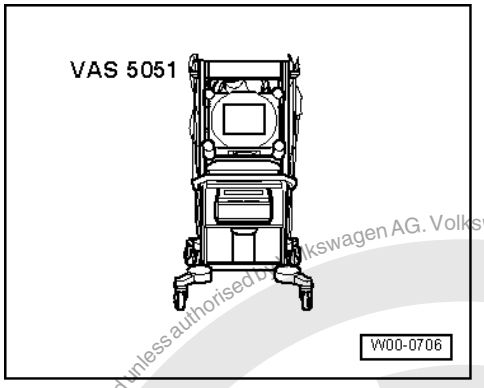
2 - Performing self-diagnosis

2.1 - Performing self-diagnosis

Warning!
- You must always secure testing and measuring equipment on the back s
- These devices may be operated only by a passenger during a test drive.



Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- VAS 5051 Vehicle diagnosis, testing and information system

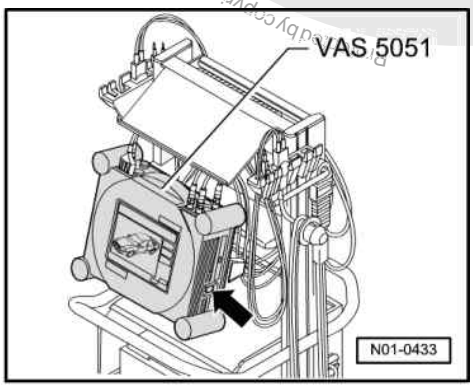
Additional information

- Vehicle diagnosis, testing and information system VAS 5051; User's Handbook (order no. 7KE3180-1AE)
- Workshop Manual Caddy 1996 ▸, Polo Classic 1996 ▸, Polo Estate 1998 ▸, Automatic gearbox 01M
- Current flow diagrams, Electrical fault finding and Fitting locationsbinder
- Technical service handbook
- Parts catalogue

Test conditions:

- Selector lever in position "P" and handbrake applied.
- Vehicle voltage supply in order.
- All fuses according to current flow diagram OK (remove fuse from fuse holder to check).
- Fuses in main fuse box OK.
- Check earth connections for gearbox:

- Check earth connections for corrosion and poor contact; repair if necessary.
- Earth connection point is located in plenum chamber.



Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG. Reproduction, in part or in whole, for commercial purposes, is not permitted unless authorised by Volkswagen AG.
satelettronica

- Check battery earth strap and earth strap between battery and gearbox.

Connect vehicle diagnosis, testing and information system VAS 5051

- -> Switch on tester -arrow-.

The tester is operational when it displays a picture of a car.

- Connect diagnosis cable connector VAS 5051/1 or VAS 5051/3 to diagnosis connection.

Locations of diagnosis connections

The vehicle could have the diagnosis connection at various places depending on the year of manufacture. A clear indication of where the connection is located can be found in

=> Automatic gearbox 01M; Repair group 37; Electrical and electronic components and fitting locations Electrical and electronic components and fitting locations

- Switch on ignition.
- Touch the field "Vehicle Self-diagnosis" on the touch screen.

Example of screen display:

Vehicle self-diagnosis	
Select vehicle system	
00 - Interrogate fault memory - entire system	
01 - Engine electronics	
21 - Engine electronics I	
41 - Engine electronics II	
02 - Gearbox electronics	
65 - Tyre pressure monitoring	
03 - Brake system electronics	
23 - Brake servo	
12 - Clutch electronics	
44- Steering assistance	
" "	
" "	
" "	
Test instruments	Go to / Print / Help

You can press 00 - Interrogate fault memory - entire system. Then the tester will interrogate all fault memories.

When doing so, please observe the notes beginning => 2 .

If you want to select only the gearbox control unit:

- Press 02 - Gearbox electronics.

Now the following diagnosis functions (among others) will be displayed on the screen:

Diagnosis function overview

On the screen of the VAS 5051:	
02 - Interrogate fault memory	7
04 - Basic setting	15

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

On the screen of the VAS 5051:		
05 -	Erase fault memory	14
06 -	End output	28
08 -	Read measured value block	15

Further functions in this display need not be considered.

Interrogating fault memory

- Press 02 - Interrogate fault memory.

-> The number of stored faults or "No fault recognised" appears in the display.

```
X Faults recognised!
```

- For a list of all faults, refer to => 7 .

Displayed on screen	
No fault recognised!	If "No fault recognised" appears after repairs are performed, the self-diagnosis is completed. In the event that the automatic gearbox does not shift properly despite self-diagnosis, the cause can be found using the operating mode "guided fault finding". Refer also to the => binder "Fault finding, Power transmission", No. 14

Control unit identification

The control unit identification is displayed at the top right of the screen after the gearbox control unit is selected in the operating mode "vehicle self-diagnosis".

satelettronica

4 - Erasing fault memory

4.1 - Erasing fault memory

Requirement:

- Fault memory interrogated => 7 .

- Connect VAS 5051 and continue to switch until the diagnosis functions are displayed => Performing self-diagnosis; 5 .
- Press 05 - Erase fault memory.

-> Indicated on display:

```
Warning!
Fault memory was not interrogated.
```

If the ignition was switched off e.g. between interrogating the fault memory and erasing fault memory, the fault memory is then not erased.

- Adhere strictly to the sequence of operations, i.e. first of all interrogate fault memory.

-> Indicated on display:

```
Fault memory could not be erased
```

If one or more faults are present.

- Interrogate fault memory => 7 .

-> Indicated on display:

```
Fault memory is erased!
```

(The fault memory will be erased approx. 5 seconds. after the display appears.)

The fault memory is now erased.

- Switch off ignition.

Wait about 1 minute before again interrogating the fault memory.

-> Indicated on display:

```
00811      3333
System not interrogated
```

Control unit -J217- was not given sufficient time to recognize faults.

- Wait about 1 minute before again interrogating the fault memory.
- After interrogating and erasing the fault memory, carry out a test drive and again interrogate the fault memory.

When the fault memory is interrogated, the following display should appear:

"No fault recognized!"

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.

5 - Initiating basic setting

5.1 - Initiating basic setting

The basic setting should be initiated after performing the following repairs:

- Exchanging engine
- Replacing or coding engine control unit
- Removing and installing gearbox
- Removing and installing valve chest
- Removing and installing "electronic accelerator"
- Replacing throttle valve potentiometer -G69-
- Altering throttle valve potentiometer -G69- setting e.g. when adjusting idling switch (engine)
- Removing and installing throttle cable with kick-down switch
- Replacing automatic gearbox control unit -J217-

- Read also:

=> "Special Information Bulletins" binder; Engine; No. 4

If the ATF level is correct, complaints about shift quality can, in part, also be rectified with "Basis setting".

- Connect VAS 5051 and continue to switch until the diagnosis functions are displayed => Performing self-diagnosis; 5 .
- Press 04 - Basic setting.
- Press key 0, 0 and 0.
- Confirm entry with key Q.
- Depress accelerator pedal past kickdown to stop and hold in this position for 3 seconds.

No further display appears on tester.

The system is now in the basic setting.

6 - Read measured value block

6.1 - Read measured value block

Additional information

- Workshop Manual Caddy 1996 ▸, Polo Classic 1996▸, Polo Estate 1998 ▸, Automatic gearbox 01M
- Current flow diagrams, Electrical fault finding and Fitting locationsbinder

- Connect VAS 5051 and continue to switch until the diagnosis functions are displayed => Performing self-diagnosis; 5 .
- Press 08 - Read measured value block
- Press the number for the display group that you want to see.
- Enter display group number => List of selectable display group numbers, 15 .
- Confirm entry with key Q.
- There are always 4 display zones in the measured value block (if necessary, in physical quantities). Interpreting the values in display zones 1 to 4 =>Test table 17 .

1) When driving, a second mechanic is needed for reading the specified values.

Reading measured value block; Display group number 004; "Checking solenoid valves whilst driving"

- The solenoid valves can be checked whilst driving via "Read measured value block 08"; "Display group number 004". A second mechanic is required for the read out whilst driving.
- The table shows the solenoid valves -N88-, -N89- and -N90- as activated in each selector lever position. These solenoid valves control the switching valves to the relevant gears.
- The solenoid valve -N91- activates the lock-up clutch modulation valve and is not covered here.
- The solenoid valves -N92- and -N94- are valves which ensure a smooth gear shift and are only activated during gear shifts and displayed in zones 5 and 6. They can show "0" or "1", depending on driving situation.
- VAS 5051 display zone 1 has 6 characters (0000 00):

Display on VAS 5051 Display group number 04 - zone 1:					
Display 1	Display 2	Display 3	Display 4	Display 5	Display 6
Solenoid 1 -N88-	Solenoid 2 -N89-	Solenoid 3 -N90-	Solenoid 4 -N91- (may be disregarded)	Solenoid 5 -N92-	Solenoid 7 -N94-

- Non-activated solenoid valves display "0" and activated solenoid valves display "1".
- All solenoid valves are checked via self-diagnosis => Interrogating fault memory, page 7 .

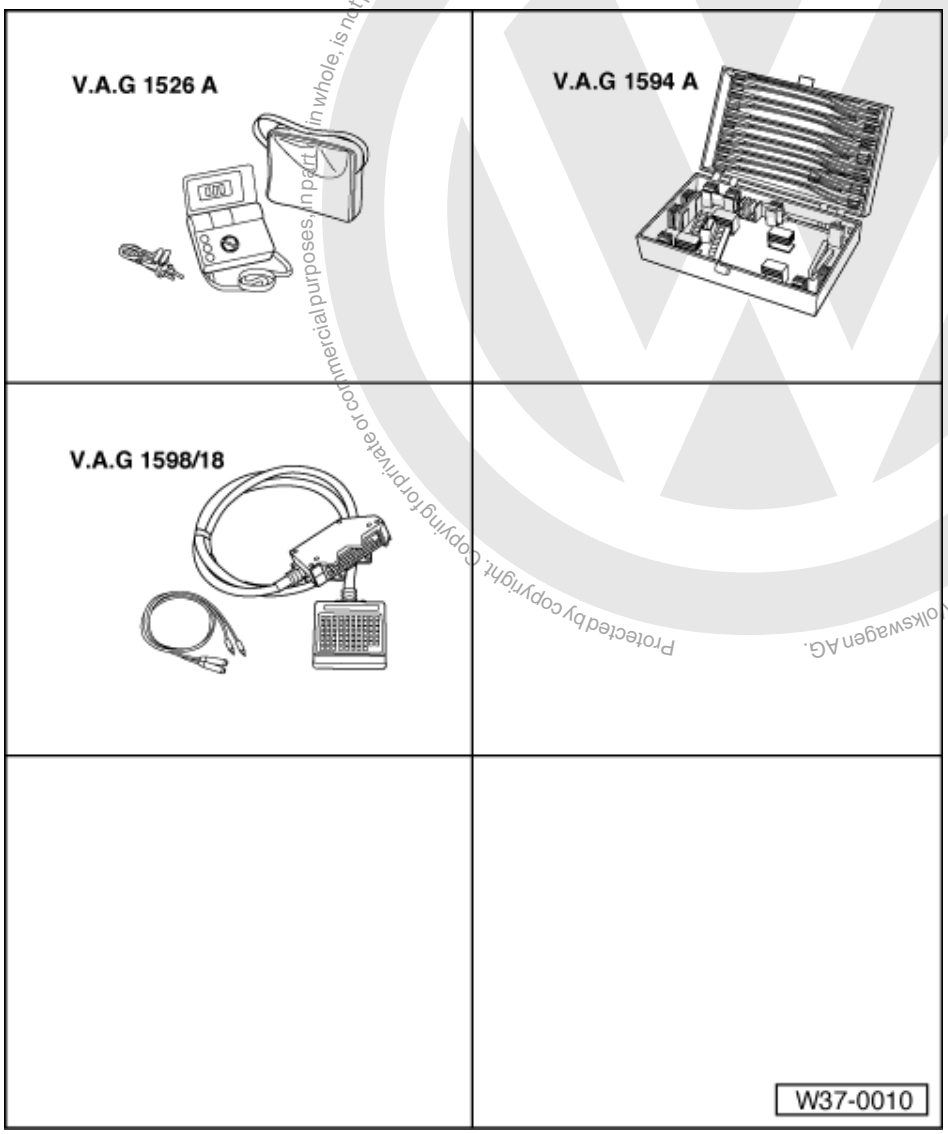
8 - Gearbox: Electrical check

8.1 - Gearbox: Electrical check



Special tools, testers and auxiliary items

- Hand multimeter V.A.G 1526 A
- Adapter set V.A.G 1594 A
- Test box V.A.G 1598/18
- VAS 5051 Vehicle diagnosis, testing and information system

satelettronica

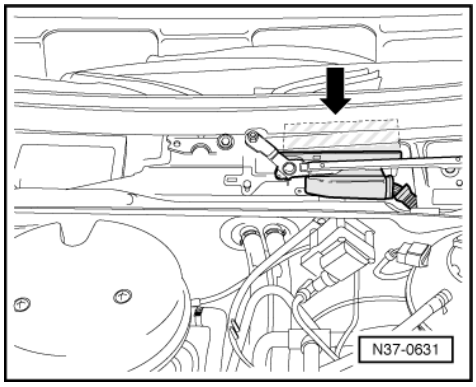
If VAS 5051 is used, V.A.G 1526 A is not required.

Additional information required

- Workshop manual Caddy 1996 ‣, Polo Classic 1996 ‣, Polo estate 1998 ‣, Automatic gearbox 01M
- "Current flow diagrams, Electrical fault finding and Fitting locations"binder

Test requirements:

- Battery voltage in order.

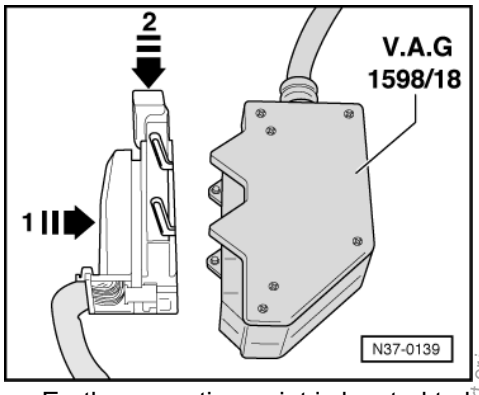


- Switch ignition and electrical consumers off before commencing the check (headlights, lighting, fan ...).
- Fuses in main fuse box OK.
- Fuses must be OK (remove fuses from fuse holder to check).

=> Current flow diagrams, Electrical fault finding and Fitting locations binder

-> The gearbox control unit (arrow) is located in the plenum chamber.

- Check earth connections for corrosion and poor contact; repair if necessary.



- Earth connection point is located to left of relay plate.
- Check battery earth strap and earth strap between battery and gearbox.
- Switch ignition off, release multi-pin connector and pull off control unit.
- -> Fit test box V.A.G 1598/18 onto multi-pin connector (1) and lock, in direction of arrow (2).

Using test box V.A.G 1598/18 the wiring can be checked according to current flow diagram.

- Before connecting the test leads the correct measuring range on tester must be adjusted. Otherwise the electronic components can be destroyed !

- The specified values are valid for an ambient temperature from 0 °C...40 °C.
- If the readings obtained differ from the specified values, determine fault on the basis of the current flow diagram.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

- If the readings obtained differ only slightly from the specified values, clean sockets and connectors of the testers and test leads and repeat test. Before replacing the particular components, test wiring and connections and, particularly if specified values are below 10 ω, repeat resistance measurement on component.

51- Vacant	66- Gearbox speed sender -G38-
52- Vacant	67- Solenoid valves voltage supply
53- Vacant	68- Vacant

List of test steps (multi-pin connector with 68 pins) 1)

Component checked		Component checked	
Supply voltage from control unit -J217-	- Perform test step 1	Solenoid valve 6 -N93-	- Perform test step 10
Brake light switch -F-	- Perform test steps 2	Solenoid valve 7 -N94-	- Perform test step 11
Throttle valve potentiometer -G69-	- Perform test step 3	Kickdown switch -F8-	- Perform test step 12
Selector lever lock solenoid -N110-	- Perform test step 4	Gearbox oil temperature sender -G93- (ATF)	- Perform test step 13
Solenoid valve 1 -N88-	- Perform test step 5	Road speed sender -G68-	- Perform test step 14
Solenoid valve 2 -N89-	- Perform test step 6	Gearbox speed sender -G38-	- Perform test step 15
Solenoid valve 3 -N90-	- Perform test step 7	Multifunction switch -F125-	- Perform test step 16
Solenoid valve 4 -N91-	- Perform test step 8		
Solenoid valve 5 -N92-	- Perform test step 9		

1) Perform only the test steps listed in the fault table or in the measured value block according to component.

8.2 - Test table

Switch to voltage measuring range 20 V					
Test step	V.A.G 1598/18 sockets	Test of	▪ Test conditions - Additional operations	Specified value	Rectifying fault
1	23 + 1 and 45 + 1	Supply voltage from control unit -J217-	▪ Ignition switched on	approx. battery voltage	- Check wiring using current flow diagram => "Current flow diagrams, Electrical fault finding and Fitting locations" binder
2	15 + 1	Brake light switch -F-	▪ Ignition switched on ▪ Brake pedal not depressed	0 V	- Check wiring using current flow diagram => "Current flow diagrams, Electrical fault finding and Fitting locations" binder

satelettronica

			- Brake pedal depressed	approx. battery voltage	- Adjust or renew brake light switch => Brake systems; Repair group 45; Adjusting brake light switch Adjusting brake light switch

Switch to resistance measuring range 20 k ω					
Test step	V.A.G 1598/18 sockets	Test of	▪ Test conditions - Additional operations	Specified value	Rectifying fault
3	5 + 28	Throttle valve potentiometer - G69-1)	▪ Ignition switched off Throttle pedal position: Idling min. Idling max.	0.7 kω 1.8 kω	- Check wiring using current flow diagram => "Current flow diagrams, Electrical fault finding and Fitting locations" binder - As the throttle is opened from idling to full throttle, the resistance changes continuously - Adjust throttle valve potentiometer, renew if necessary => Repair group 24 to 25 of respective engine code - Initiate basic setting => page 15
			Full throttle min. Full throttle max.	2.1 kω 3.9 kω	
	5 + 50	Throttle valve potentiometer - G69-1)	Idling min. Idling max.	2.1 kω 3.9 kω	
			Full throttle min. Full throttle max.	0.7 kω 1.8 kω	

1) Engine with Mono Motronic - Coolant temperature min. 80° C.Cannot be checked on vehicles with TDI and SDI engine or 4-cylinder engine with Simos and Motronic injection and ignition system, the throttle valve potentiometer -G69- signal is transmitted via engine control unit to gearbox control unit and can only be checked by measured value block => Page 15

Switch to resistance measuring range 200 ω					
Test step	V.A.G 1598/18 sockets	Test of	▪ Test conditions - Additional operations	Specified value	Rectifying fault
4	23 + 29	Selector lever lock solenoid - N110-	▪ Ignition switched off	14 to 25 ω	- Check wiring using current flow diagram => "Current flow diagrams, Electrical fault finding and Fitting locations" binder

satelettronica

					- Renew selector lever lock solenoid -N110- => Automatic gearbox 01M; Repair group 37; Servicing gear selector mechanism Servicing gear selector mechanism
5	55 + 67	Solenoid valve 1 -N88-	▪ Ignition switched off	55 to 65 ω	- Check wiring using current flow diagram => "Current flow diagrams, Electrical fault finding and Fitting locations" binder
	55 + 1			infinite ω1)	
6	54 + 67	Solenoid valve 2 -N89-	▪ Ignition switched off	55 to 65 ω	- Renew valve chest => Automatic gearbox 01M; Repair group 38; Removing and installing valve chest Removing and installing valve chest

1) Switch V.A.G 1526 A to highest ωrange

Switch to resistance measuring range 200 ω					
Test step	V.A.G 1598/18 sockets	Test of	▪ Test conditions ▪ Additional operations	Specified value	Rectifying fault
7	9 + 67	Solenoid valve 3 -N90-	▪ Ignition switched off	55 to 65 ω	- Check wiring using current flow diagram => "Current flow diagrams, Electrical fault finding and Fitting locations" binder
	9 + 1			infinite ω1)	
8	47 + 67	Solenoid valve 4 -N91-	▪ Ignition switched off	4.5 to 6.5 ω	Renew valve chest => Automatic gearbox 01M; Repair group 38; Removing and installing valve chest Removing and installing valve chest
	47 + 1			infinite ω1)	
9	56 + 67	Solenoid valve 5 -N92-	▪ Ignition switched off	55 to 65 ω	-
	56 + 1			infinite ω1)	
10	58 + 22	Solenoid valve 6 -N93-	▪ Ignition switched off	4.5 to 6.5 ω	-
	58 + 1			infinite	=>

satelettronica

	22 + 1			ω1)	

1) Switch V.A.G 1526 A to highest ωrange

Switch to resistance measuring range 200 ω					
Test step	V.A.G 1598/18 sockets	Test of	▪ Test conditions - Additional operations	Specified value	Rectifying fault
11	10 + 67	Solenoid valve 7 -N94-	▪ Ignition switched off	55 to 65 ω	-
	10 + 1			infinite ω1)	- Check wiring using current flow diagram => "Current flow diagrams, Electrical fault finding and Fitting locations" binder Renew valve chest => Automatic gearbox 01M; Repair group 38; Removing and installing valve chest Removing and installing valve chest
12	1 + 16	Kickdown switch -F8- (cannot be checked on TDI and SDI engines)	▪ Ignition switched off ▪ Accelerator not depressed	infinite ω1)	- Check wiring using current flow diagram => "Current flow diagrams, Electrical fault finding and Fitting locations" binder - Adjust or renew accelerator cable => Repair Group 20 of respective engine code
			- Depress accelerator as far as kickdown	less than 1.5 ω	

1) Switch V.A.G 1526 A to highest ωrange

Switch to resistance measuring range 2 Mω					
Test step	V.A.G 1598/18 sockets	Test of	▪ Test conditions - Additional operations	Specified value	Rectifying fault
13	6 + 67	Gearbox oil temperature sender -G93- (ATF)	▪ Ignition switched off		- Check wiring using current flow diagram => "Current flow diagrams, Electrical fault finding and Fitting locations" binder

satelettronica

			- Selector lever positions D, 3, 2 and 1	0 V	

1) Switch V.A.G 1526 to highest ω range

9 - Definitions

9.1 - Definitions

These explanations refer only to this assembly group: Self-diagnosis for automatic gearbox 01M. These definitions are not necessarily generally valid.

ABS

Anti-locking brake system. Further information on the ABS can be found in the relevant self-study programmes.

ATF (Automatic Transmission Fluid)

Gearbox oil for automatic gearbox

Display zone => Read measured value block

Display group number => Read measured value block

Data bus

Transportation of data. To do this the electrical signals are brought into a certain format (bus). Further information on this can be found in Self-study programme No. 186.

Data bus low (high)

The voltage used to transport the data is low (high). Further information on this can be found in self-study programme no. 186.

Throttle valve potentiometer

An engine component. The "throttle valve signal" originates from here.

Throttle valve control part

An engine component to stabilize the idling speed. The "throttle valve signal" originates from here. Further information on the throttle valve control unit can be found in self-study programme no.173.

Self-diagnosis

The capability of the control unit:

to recognise faults,

to react to faults,

to store faults,

to register faults and make them available in the measured value block.

Performing self-diagnosis

Connecting the fault reader to be able to interrogate the fault memory.

satelettronica

Performing electrical check

A targeted check of the electronic components by performing certain measurements.

Electronic power control (EPC)

Terms like: EPC, electronic accelerator, accelerator module and electric throttle operation all refer to this component. Among other things, senders -G79- and -G185- and a throttle valve positioner are housed within.

EPC is always a component of engine control and thus communicates initially with the engine control unit. Because when doing this, for example, the signal for the kickdown switch is also generated, the engine control unit stores the data in the data bus, in order that other control units have access to it.

Further information on this subject can be found in

- Self-study programme no. 210.

Vehicle diagnosis, testing and information system VAS 5051

Terms such as tester, fault reader, VAS 5051 refer to this device.

Further information on this subject can be found in self-study programme no. 202.

Throttle position sender

=>Electronic power control (EPC)

Gearbox speed sender -G38-

The sender records the speed of -K3- and transmits it to the automatic gearbox control unit.

Road speed sender -G68-

The sender records the speed of the output gear and transmits it to the automatic gearbox control unit (not to the speedometer).

Guided fault finding

One of the VAS 5051's three operating modes. The other two are "Vehicle self-diagnosis" and "Test instruments".

Initiating basic setting

The values learnt in the control unit are turned back to the initial values.

No communication

There is no connection for exchanging information between the control units.

Kickdown switch -F8-

The kickdown switch is integrated into the accelerator cable. When the accelerator pedal is depressed fully onto its stop the gearbox changes down for acceleration.

Short to earth

Current flows -incorrectly- to earth without supplying a consumer.

Short to positive

Current flows -incorrectly- to a live component without supplying a consumer.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.

satelettronica

Wiring

Routing of electrical wiring and components in vehicle.

Selector lever lock magnet -N110-

Located in the selector mechanism close to the selector lever. Prevents movement (involuntary) of the selector lever from positions "P" and "N" as long as the brake pedal is not depressed.

Solenoid valves

Opens and closes the oil channels to the clutches and brakes.

Read measured value block

The control unit can transfer a considerable amount of test data. This test data delivers information on the operational condition of the system and/or sensors connected to it. In many cases the transferred test data supports fault finding and fault rectification. The test data has been summarized into single display groups because all the information cannot be evaluated at the same time. The information can be selected via display group numbers.

Each display group number is displayed on the VAS 5051 with four display zones.

A display zone can be displayed as a series of eight digits or as values. Some of these values are displayed with a symbol indicating units.

Emergency running

"Condition of the control unit" when certain faults are recognised in order to maintain driving safety, to protect the gearbox against damage and at the same time to ensure that driving characteristics are impaired as little as possible.

Pendulum support

Designation for a part of the assembly mounting.

Sporadic

Happens occasionally

Stationary uncoupling

The gearbox shifts into neutral hydraulically when the vehicle is stationary.

Static

Present at the moment, continuous

TDC signal

The signal is used to calculate the engine speed.

Infinity ω

The resistance is infinite, open circuit.

ω = Ohm

TCC (Torque converter lock-up clutch)

Transfers the engine torque mechanically to the gearbox.

satelettronica

VAS 5051

=> Vehicle diagnosis, testing and information system VAS 5051; 38

Ignition key withdrawal lock

Ensures that the ignition key can only be withdrawn when park position is selected and in addition mechanically locks the selector lever in this position.

Ignition timing control

The engine torque is reduced during the gear shift process by altering the ignition timing.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
